Creative Generation Handoff – Wrinkle Smooth Patches

Nov 7, 2026 · @Jose Diaz

How to use this handoff

This is the one brief the creative agent team needs to make organic Instagram and TikTok content for the Wrinkle Smooth Patches by The Daily Glow Co. It condenses what the owner and Claude learned between Oct 21 and Nov 7, 2026: what the product is, who buys it, which formats worked, and how to prompt the AI tools so they stop making the same mistakes. The on-screen person comes from the owner for each job or from the saved characters in section 7; this doc covers everything else.

Read order for an agent starting a job: section 2 (product) and section 3 (research) before writing a word; section 4 to build the post; sections 5 to 8 before writing a single prompt; section 10 before anything leaves the repo.

When sources disagree: this doc wins over older briefs, then live Shopify data, then everything else. The project's original research docs (core beliefs, offer brief, full research) are still the best source for the customer's own words and objections, but their product names and prices are out of date.

Product and offer facts

The hero product is **The Wrinkle Smooth Face Set (5 Pieces)**, and the offer to push is **2 Sets for $60** (shown against $90, "Save $30", "Most popular"). Prices change often: an agent re-reads the live product page or Shopify before putting any price, deal or date in a creative.

Live offer as of Nov 7, 2026 (checked on the product page): 1 Set $45 · 2 Sets $60 (compare-at $90) · Black Friday line "your 2nd set for just $15, ends Dec 1" · free shipping on orders $40+ · 30-day money-back guarantee · free "Healthy Skin After 30" guide emailed with every set. Delivery is roughly 10–14 days on the current supplier method; the page shows no estimate yet.

What the product is: clear, thin (about 1.5 mm), soft medical-grade-looking silicone. Transparent with a slight frost; on skin you only notice it by its thin raised edge and a soft sheen. It is never opaque, never white, never coloured.

Product	Pieces and size	Shape	Where it sits on the face
Face Set (hero)	1 forehead patch, 14.3 × 6.1 cm + 4 crescents, 7.8 × 2.2 cm	Forehead: wide curved band with a small center tab. Crescents: thin curved slivers	Forehead band covers ⅔–¾ of the forehead, **tab pointing DOWN between the brows**. Two crescents under the eyes sweeping toward the crow's feet, two along the smile lines, lips uncovered
Eye Patches	1 pair, each about 7 × 7 cm	**T-shaped**: wide curved bar + central stem (not crescents)	Bar runs vertically down the outer side of the eye over the crow's feet; stem points inward under the lower lid
Smile Line Patches	Mirrored pair, about 8 × 4.5 cm	Wavy	Inner edge on the smile line, lips uncovered
Lip Line Patches	Upper + lower piece	Thin strips	Just above the upper lip, just below the lower lip, lips uncovered
Chest Pad	Single or 3-pack	Heart / Y	Below the collarbones, point toward the cleavage line; face AND chest in frame
Hand Patches	About 10 × 11 cm	Scalloped wide end + stem	Wide end below the knuckles, stem toward the wrist; hands in frame
Face, Neck & Chest Set	11 pieces	Forehead, 6 eye, 2 cheek, neck band, chest	Premium option, not the hero product

How it is used (say it exactly this way): apply to clean, dry skin with no serum, lotion or oil underneath; press each piece from the center outward so it lies flat; wear **overnight (6–8 hours)**, never "8 hours"; peel off gently in the morning; **"just clean and reuse"**, never "rinse

and dry"; store each piece on its backing film. No needles, no tape, no refills, no actives.

Names: every product is "The Wrinkle Smooth ___" by The Daily Glow Co. Say frown lines or forehead lines rather than "11s", which the customer doesn't recognise.

Who buys it (from the research)

She is a woman who rejects an expression, not her age: she wants to look **rested, not angry, and still look like herself**. The research puts the core buyer at 35–55.

Her situations, in priority order:

1. **"My frown lines make me look angry."** Fine with aging, done with the expression. Wants a relaxed brow without a frozen look.
2. **The side sleeper** whose creases on the forehead, around the eyes or on the chest no longer fade by midday. Blame-free relief: "it's my pillow, not me." Use as one angle, not every post.
3. **The needle-avoider:** priced out by injectables ($435–$586 a visit, every 3–4 months), scared of needles or a done look, or medically unable.
4. **Burned before:** tried tape or a patch that fell off by 3am or stopped sticking after 2–3 uses. Fall-off is the category's number one complaint (36% of sampled reviews).

Her own words (competitor buyers' words from the research; use them as language and hooks): "make me look angry all the time" · "I need them gone" · "I'm trying everything I can before botox because the price, and I'm terrified" · "woke up with it screwed up on my bedside table" · "they do seem to blur wrinkles after waking" · "noticed a difference after the first night" · "This ad… can't be real" (her verdict on over-edited before/afters).

The beliefs to move her through, one per post, in this order:

1. Holding the skin flat and sealed in moisture all night visibly smooths lines by morning, with nothing going under the skin. This is the north star.
2. The patches she tried failed because they fell off or weren't shaped for each area, not because patches don't work. This kit covers the whole face.
3. It's gentle enough for every night, even under the eyes, and takes 30 seconds.
4. One reusable kit is smarter money than tape refills, knockoffs or $435+ injections.
5. The Daily Glow Co. stands behind it: 30 days to love it or get her money back.

Optional opener for side-sleeper and chest creative: a lot of her lines are pressed in every night while she sleeps, so they're something she can stop.

Objections creatives should answer (pick one per post): will it stay on all night if I toss and turn · will it stop sticking after a few uses · is it safe under my eyes, will it leave red marks or break me out · is this TikTok hype, the before/afters look fake · why not just get Botox · why $45 when Amazon has $13 sets · how do I clean it · how long does shipping take · are the reviews real, will I really get a refund.

How to build a post

Every post follows the same five beats, taken from our ad-building skills; they work the same for organic. Treat each post as an experiment: ship variants and keep what the numbers reward.

Beat	Time (15–30 s video)	Job
1. Hook	0–3 s	Stop the scroll: visual, sound and on-screen text all land in the first 2 seconds
2. Problem	3–8 s	Name the pain she already feels (looking angry or tired, lines that no longer fade by midday) so she feels seen
3. Offer	8–18 s	The patch as the answer: what it is, the "aha" of how it works, how easy it is; show the product
4. Proof and risk reversal	18–24 s	The demo (on at night, peeled off in the morning), the specs, the 30-day money-back guarantee, free shipping
5. CTA	last 2–4 s	One action: "Link in bio" or "Comment SMOOTH and I'll send you the link"

The hook is three things at once: a visual with motion in frame one (never a static title card), a sound (a voice line, a sound effect, a product sound) and on-screen text of 8 words or fewer that reads in under a second. If only one can be great, make it the visual; most people start with the sound off. Put her world in the first second and the product on screen by second 3: a viral format that doesn't turn into the patch within 3 seconds gets views and no sales.

Hook types to draft from (write five or more, keep the strongest three):

- Outcome or reveal: "Peel it off. Smoother-looking skin underneath."
- Objection flip: "Finally, a wrinkle patch that actually works." (the owner's favourite)
- Identification: "Look rested. Still look like you."
- Mechanism: "Holds your skin smooth all night. You just sleep."
- Value or math: "Five pieces. Your whole face." (check per-patch maths against the live price)
- Pattern interrupt: "Don't buy wrinkle patches until you read this."
- Simplicity: "No needles. No tape. No refills. Just clean and reuse."
- Counterintuitive truth: "Some of the lines you see in the morning were pressed in overnight."
- POV or meme: something she does in private, then the patch.
- Direct callout: "If your frown lines make you look angry, watch this."
- Self-aware: "This is a wrinkle patch video. Give me 10 seconds."

What makes the copy land: one idea per post (one tension, one promise, one offer) that moves her one belief from section 3. Specifics beat adjectives: sizes, pieces, price per patch, guarantee terms. Metaphors make the mechanism instant: "an iron for your face", "a retainer for your skin". Push one dimension to the edge (whole-face value, the most specific detail, the strongest guarantee) instead of being average on all of them. Gaps competitors leave open: the whole face in one kit, a side-by-side against paper tape, Spanish content, the gift angle ("one for you, one for your mom"). Real-looking beats polished: phone framing, natural light and unretouched skin read as content; glossy visuals read as an ad and get scrolled.

Adapting a reference post: break it down first in a table (Element | What they did | Why it may persuade) covering the hook, promise, proof, CTA, mechanism, offer and 3–5 visual choices (reading order, scale, contrast, demo, framing, text density). Then map their mechanism → a tension from the research → the belief shift → our copy and visual. Copy formats and principles, never a creator's exact words, face or signature bit.

Brief template (filled in before any generation):

```
## [Concept name] — [TikTok / Reels], [length] s
Angle: one sentence on the idea and why it should work for her.
Hook variants (same body):
  A. Text: "…" | Visual: … | Sound: …
  B. …
  C. …
Beat sheet: Time | Beat | Visual (asset or prompt) | On-screen text | VO / sound
Caption: problem → solution → CTA, 3–5 hashtags.
Production plan: reused assets (section 7), new generations with model and estimated credits, total cost.
What we're testing: the one variable this post isolates and the metric that decides it.
```

Video specs: vertical 1080 × 1920 master; text below the top 14% and above the bottom 35% (app UI); the product on screen in the first 1–2 seconds; one action per shot; voice-over planned at 2.3 words per second (the ElevenLabs narrators read closer to 2.9), with clip lengths set from the word count and never a sped-up voice; a short cut of about 25–38 s from the same clips; lips closed or a small closed-lip smile with patches on.

Testing principles: the hook is the post, so the first 2 seconds get the most effort. Change one variable at a time (hook, body or CTA) so results teach something. Volume beats polish: a remix of a working post with a new first frame and a new hook is a legitimate new test, and the new first frame keeps the grid from looking like a repost.

Prompting Higgsfield (stills, characters, product)

The one rule that fixes most failures: **never let a model invent the patch.** Every prompt that shows the product uploads a real product reference and pastes the same PATCHES block, word for word. Most bad renders so far came from a model guessing the shape, colour or placement.

Which model for which job:

Job	Use	Notes
Person + product + pose in one image	Nano Banana 2 / 2.1 (multi-reference) or Elements	Soul 2.0 accepts only ONE reference image, so it can't do person + product

Job	Use	Notes
Reusing a saved character or product	Elements, written as `<<<element_id>>>` in the prompt	Elements work only on Nano Banana Pro / 2, GPT Image 2, Seedream 4.5 / 5.0 lite, Cinema Studio Image 2.5, and for video Seedance 2.0, Kling 3.0 with a start image, Cinema Studio video
Cleaning up a blurry supplier photo	One single-photo cleanup on Nano Banana 2, 4K	Worked where a 4-view sheet failed: "keep outline, don't copy blur, halos or blown-out white, clear frosted, not opaque"
Character sheet	Nano Banana 2.1, 4-panel sheet (front, side, close-ups) from 3 real photos, then save as an Element	Turns photos of a person into a reusable character

Cost reference: Nano Banana 2.1 at 4K is about 1.5 credits an image. In the web app, upload images first and paste the prompt last (adding an image wipes the prompt). HEIC isn't accepted; convert to JPG.

The process that produced approved images:

1. Start from the owner's avatar or a saved character (section 7), bare-faced, with no patches.
2. Product-on-face image = an edit with two references, each with one stated role: the owner's avatar as the person, the product render as the product, plus exact placement text.
3. Style changes = an edit of the approved shot: "Keep everything as placed. CHANGES ONLY: …". Never regenerate from scratch to change a colour or outfit.

Product-only shots: clear silicone disappears on white, so always shoot it on a tinted surface or against backlight. Brand studio look: mist surface, deep teal (#17393D) backdrop, sunrise-orange grazing light, a few water droplets. Always show fingers or a face for scale; a patch alone reads as a chest pad. Never draw the product as a vector illustration; it was rejected every time.

People: use the avatar the owner provides or a saved character from section 7, as given. What the patches need from any avatar: hair pulled back off the forehead so the forehead piece shows, and with patches on, a calm face with lips closed (the owner banned smiling with patches on because it looks unrealistic).

Statics in Higgsfield: default 4:5 (1080 × 1350). One solid background (Soft Mint #F4F8F6), Poppins, Deep Teal #17393D text, Sunrise Orange #F08A2C accents. The proof image takes 60–70% of the frame; the headline is 9 words or fewer. AI text rendering is unreliable, so put the final words on in code or Canva when exact wording matters.

Blocks every prompt reuses (paste them verbatim):

PATCHES (Face Set; swap the shape lines for other products):

```
The patches are the exact clear silicone pieces shown in the product
reference, and nothing else. They are thin, transparent and slightly frosted;
her skin and lines stay visible through them; they are noticed only by a thin
raised edge that catches the light and a soft satin sheen. They are never
white, beige, pink, gold, opaque, gel pads, hydrogel, fabric, paper or tape.
Forehead piece: a wide, gently curved band covering the middle two-thirds of
the forehead, with a small rounded tab at the centre of its lower edge
pointing down between the eyebrows; it does not reach the hairline. Under-eye
pieces: one slim crescent per eye, just below the lower lashes, following the
curve of the lower lid, the outer end reaching toward the outer eye corner;
never covering the eye or lashes; never circles, rings or glasses shapes.
Smile-line pieces: one slim crescent on each side, along the fold from beside
the nostril to beside the mouth corner; the lips stay uncovered. Every patch
lies completely flat, with no bubbles, folds or lifted edges. A piece the
prompt does not mention is not on her face.
```

REFERENCE ROLES (start of every multi-image prompt):

```
Identify the reference photos by what they show, not by upload order. THE
CAST PHOTO shows the only person in this image; keep her face, skin, age,
hair and earrings exactly as shown. THE PLACEMENT PHOTO shows a different
person wearing the patches; use it only for where each piece sits and never
copy that person's face, hair or skin. THE SHEET PHOTO shows the five pieces
on their backing sheet; use it for exact shape, size and transparency.
```

STYLE (end of every realistic image prompt):

```
Photorealistic smartphone photo, unretouched, no beauty filter, visible pores and natural skin texture, sharp focus on her face. Her hair is pulled fully back off her forehead. The skin is dry and matte with no cream or lotion. No mirror in the shot. No text, captions, logos or watermark.
```

Prompting Runway, Gemini/Veo, ElevenLabs and code

Video is where the credits go and where most mistakes happened. Fix the still before animating it, lock both the start and end frame of every shot that must connect to another, and give the model one action per clip.

Runway: models and real costs we paid

Need	Model	Cost	Watch out
Product stills, placement, statics	Nano Banana Pro, 2K	20 credits / image	Multi-reference; give each reference one role
Chained shots (start AND end frame)	Kling 3 Pro	12 credits/s silent; 5 s minimum = 60	The workhorse for continuity
Talking character with native audio	Kling 3 Pro + audio	17 credits/s (85 for 5 s); one run billed 105	Verify the price before quoting it
Simple B-roll from one start image	Gen-4.5	12 credits/s, 720p	**No end-frame support**: never use it for chained shots (it produced a useless fly-past)
Reference-rich sequences with audio	Seedance 2.5	20 credits/s draft, 68 at 1080p	Draft first
Fix part of a good shot	Aleph / Edit Studio	28 credits/s	Preview a keyframe first
Music bed	eleven-music	about 5–22 credits	Asked for 13 s, got 17.5 s: always check the length

The owner is on Runway Pro ($35/month, about 2,250 credits). Judge models by **cost per usable shot**: all credits spent on a shot family ÷ shots accepted.

Runway prompting rules:

1. Each reference gets one role: identity / pose / light, or patch geometry and translucency, or placement only. Say which controls what.
2. Image-to-video prompts describe **motion only**; the image already sets the subject, framing and light. Lead with the critical movement.
3. Write motion as timed beats with positions: "0–1 s… 1–3 s… 3–5 s", start position, path, end position, camera locked, what must NOT move, no new objects.
4. Make every end frame unambiguous: the patch fully on, or fully off and held in the fingers. An end frame with the patch half-on made the model leave a copy on the skin.
5. Never pass a multi-panel or split reference image. The model rebuilds the whole layout (105 credits wasted). Crop to the one subject first.
6. Never launch a clip from a start image nobody checked against the checklist in section 11.
7. Two focused attempts per defect, then simplify the motion, change the source or cut around it.

Continuity method (keeps a character and product consistent across shots): design pack first (character sheet, expressions, a night and a morning colour frame) → storyboard as a chain of keyframes where the end of shot N is the start of shot N+1, each keyframe an EDIT of the previous one, with a written state list per frame (patch on or off, what's in frame) → animate each shot between its start and end frame → voice-over, captions and end card in assembly.

A motion prompt that worked: "Locked-off macro close-up, camera does not move. 0–1 s… 1–2.5 s… 2.5–4 s… 4–5 s. The eye stays closed and still, lashes do not move; the patch does not move, bend or change shape; lighting does not change. Only the crow moves. Smooth, weighty motion; no camera shake, no zoom, no new objects."

Talking characters: voice and picture must be generated together or the lips won't match (a separate voice laid over a silent clip was rejected). Don't write stressed words in ALL CAPS; a capitalised "HAPPEN" came out as "HA-HAPPEN". Describe the emphasis instead. If one word glitches, cut it out on frame boundaries before paying for a re-render. For a keyed character, size it by its face on screen: at least 250 px wide on a 1080-wide frame.

Gemini / Veo / Gemini Omni (free or cheaper route):

- Veo makes one roughly 8–10 s clip per request. It can't edit, add voice-over, music or text; those happen in assembly.

- It often returns 16:9 at 1280 × 720 even when asked for vertical. Set 9:16 in Flow before generating and check the first clip. Fallback: crop a 405 × 720 window (move it off-centre to keep the hands) and scale to 1080 × 1920 with a light sharpen.
- Each 10 s clip used about 20% of the daily Gemini allowance (4–5 clips a day). Gemini Omni 1.1 Flash via ElevenLabs cost about 12,000 credits per 10 s clip.
- Prompt skeleton that produced usable clips: a REFERENCE PHOTOS block naming each photo by what it shows → "the cast photo is a reference for identity only; it is not the first frame; the video opens directly on shot 1" → THE PERSON: the chosen character's description, word for word, with its fixed identifiers and hair off the forehead → "SHE DOES NOT TALK: lips stay closed" → the PATCHES block → SKIN → CAMERA AND SET (distance, height, light direction, background objects, no mirror) → timed shots joined by one hard cut → rules (exactly two hands with five fingers, no fades, no text, audio spec).
- For a talking presenter: "She says exactly these words, in this order, and nothing else: …", the same voice description word for word in every prompt, generated in the same chat to keep the voice, timed gestures, "only her voice and quiet room tone".

ElevenLabs voice (via Runway or direct): model eleven_v3, one MP3 per line, pauses tightened to about 0.28 s, mastered to −16 LUFS. Narrator **Lara** (stability 0.45, style 0.5, similarity 0.75) replaced Niki as more persuasive. A loud cartoon character worked with stability 0.3, style 0.85 and tags like [shouting]. Only preset voices were available on this workspace. Generate four short transition sounds once (whoosh, soft pop, caption click, short register ding) and reuse them.

Code (Claude Code / ffmpeg / Playwright):

- Use code for overlays (reply bubble, red X, check-mark pills, price tags, research card), end cards, captions, static posts and all assembly. These cost no credits and render exactly.
- Don't promise reference-level 3D from code. Code-drawn cross-sections and pillow/tape animations were rejected as basic; the realistic skin cross-section came from an image model.
- Pipeline: HTML canvas with draw(t) → Playwright frame capture → ffmpeg H.264 (CRF 16, yuv420p, faststart) → a contact sheet (one frame every 0.5 s) checked before calling it done.
- Assembly: master at −16 LUFS, music ducked about 10 dB under speech, J-cuts when a line runs longer than its clip, captions as an SRT or added in CapCut rather than burned under the end card.

Reusable assets

Reuse these before generating anything new: every character, patch image and clip below is already approved and costs nothing to pull. Runway items are task IDs; Higgsfield Elements go in a prompt as <<<element_id>>>.

Characters

Character	What exists	Where	ID
25-year-old woman (East Asian)	Bare-face portrait	Runway	2aed9b2b
35-year-old woman (Black)	Bare-face portrait	Runway	fe59332f
45-year-old woman (white)	Bare-face portrait	Runway	2652b5b2
45-year-old woman (white)	Wearing the Face Set	Runway	53be5c97
Night Peel woman (blonde, mid-40s)	Night start, night end, morning start, morning end frames; night clip; morning peel clip	Runway	7022062b, a8aa5375, b3f11bba, 13aac652; 0abc737a; 550ad58a
Woman of about 50 (Latina)	WOMAN.png, AFTER.png and the week-by-week clips	Owner's files	
Presenter at a desk	DOCTOR.png, PRESENTER.png and talking clips A, B, D2 and G4	Owner's files	
Woman of about 40–45 in a robe	Reference image	Higgsfield media	3bcb3615

Patches (Higgsfield Elements)

Element	ID	Note
Face-Patch (5-piece sheet)	252769ce	Renders the forehead piece upside down: always place it tab down

Element	ID	Note
Forehead-patch	6375c707-7ad9-4df9-b7e0-69750993e7aa	Clear band, center tab, 14.3 × 6 cm
Eye-patches (crescent pair)	9d766c06-2818-43e8-8ec4-1aac02d63897	The Face Set's under-eye crescents
Eye-Patch-T	t-eye-patch 154d34b0	The standalone Eye Patches (T-shape); source upload f69e8133
Smile-Line-Patch	7c32bab5	
Lip-Line-Patch	2a6a75d7	
Chest-Patch	bab38c82	
Hand-Patch	afdaf565	

Patch images

- Worn on a face, calm, lips closed (Runway): Face Set 53be5c97 · Forehead 7af2e105 · Smile Line e16afd6c · Chest 524eaf7c · Hand 62ac5b70 · 11-piece 162a8a2a · Under-Eye 878d942b (older crescent shape).
- Worn on a face, smiling (Runway): Face Set 0fb86087 · Forehead bc5332a3 · Smile Line 8aac2539 · Chest 6dbf4257 · Hand 17d34a90 · 11-piece 237b535f · Under-Eye 848d0b85.
- Product only, brand studio look (Higgsfield): Face Set 564c68fa · Forehead f3fbd28d · Under-Eye 5ad6b508 · Smile Line dc3ee260 · Chest 0d919a1f · Hand b186063a · 11-piece 2b6f1e2b.

Clips and graphics (Runway)

- 3D skin cross-section set, all edits of one base: base 4478cf98 · needle 10cae659 · clear patch on top d7e35b5e · base → patch clip 53a8695f · needle → base clip 244b7231.
- Face Set sheet held to a window, 5 s: bd37ae30.
- On green screen: patch mascot 6b1b4804 · talking syringe 711ace8a.

Known failures and the fixes

Every item below happened at least once on this product. The peel is the hardest shot; most other failures come from a model guessing something the prompt didn't pin down.

Failure	Where it happened	Fix
Patch splits in two, goes rigid like a shell, floats off or snaps off during the peel	Three Gemini peel clips, Nov 2–3	Use the peel wording below; keep the peel 3–4 s; lock wearing and bare frames; if it fails twice, cut lift → bare skin, or film it for real
Model invents the patch: white, beige, opaque, gel pad, tape	Early renders	Upload the real product every time and paste the PATCHES block with its "never" list
Under-eye pieces come out as circles or glasses-shaped outlines	Night Peel apply clip	"Just below the lower lashes, following the lid; never circles, rings or glasses shapes"; crop the placement reference to one face
Forehead tab points up	The 5-piece sheet render	Always write "tab pointing DOWN between the eyebrows"
Forehead patch too small	First character shot	"Covers the middle two-thirds of the forehead; does not reach the hairline"
Model leaves a copy of the patch on the skin after peeling	Crow clip 10	End frame with the patch fully off, held in the fingers beside the face, bare skin, "exactly ONE patch"
Patches already on before she applies them	Application shots	Separate bare-face start image; split "applying" and "wearing" into different shots
Patch slides, shifts or disappears	Moving shots	Less head movement, shorter shot, fix the source still

Failure	Where it happened	Fix
Clear silicone invisible	White backgrounds, flat light	Side light at about 45° or backlight, tinted surface, "a thin raised edge that catches the light"
Hands deform	Hand-to-face shots	Simpler action, cut to a close-up, "exactly two hands with five fingers each", or real footage
She talks when the plan is voice-over	Week-by-week clips	"SHE DOES NOT TALK: her lips stay closed the whole time"
Video opens inside the reference photo's room	Gemini clips	"The cast photo is a reference for identity only; it is not the first frame; the video opens directly on shot 1"
A second person's face gets copied	Placement reference	"A different person; use only for placement; never copy that person's face, hair or skin"
Whole split-screen layout rebuilt	Multi-panel reference (105 credits wasted)	Crop every reference to one subject
Morning peel shot in night lamp light	Night Peel v1	Name the morning light source: "soft daylight from a window on the right"
Skin airbrushed; wrinkles smoothed by the video model	Most video models	"Unretouched, visible pores, no beauty filter"; "her wrinkles do not change during the clip"
Garbled reflections	Mirror scenes	No mirror in frame
Unwanted cream or shine on the face	Night scenes	"Skin is dry and matte, no cream or lotion" (unless the shot is about cream)
Bangs hide the forehead and the patch	Character portraits	"Hair pulled fully back; nothing falls on the forehead"

Failure	Where it happened	Fix
Stuttered word in native dialogue	Crow intro ("HA-HAPPEN")	No ALL CAPS in dialogue; describe emphasis; cut the glitch on frame boundaries
Voice changes between clips	Multi-clip presenters	Identical voice description in every prompt, same session, or one narrator re-voiced
Garbled on-screen text	AI-rendered text	Add all text in code or the editor
The CTA goes unseen	Small button under the caption area	Give the CTA its own full-screen beat

Peel physics (from real footage of a silicone forehead patch, 3.6 s). The real motion is a fold-back, not a lift:

1. 0–0.9 s: fingertips pinch the outer edge at the temple and lift only that corner a few millimetres.
2. 0.9–2.7 s: she pulls the free edge sideways across the forehead, flat against the skin. The peeled part folds back 180° over the part still attached; a straight fold line with a bright highlight travels across the forehead. The doubled part looks slightly frosted; the attached part stays glossy.
3. 2.7–3.2 s: the last edge lets go at the other temple. The patch hangs from her fingertips as one soft, curved, translucent sheet.
4. 3.2–3.6 s: eyes close briefly, a relaxed exhale.

The skin underneath is dewy and slightly glossy with a few tiny trapped air dots, never red, never marked: a visual proof of "locks in moisture". Camera: front-camera selfie, slightly above eye level, about 30–35 cm, gentle handheld sway.

In prompts, write "folds back over itself", "pulled sideways close to the skin" and "a fold line travels across". Never write "lifts away" or "peels off" on their own: models read them as lifting outward, which is what breaks the patch. The reference clip is someone else's footage: use it as a motion reference only, never in a post.

Static posts

Statics are a secondary format: cheap to make in code and good for the Instagram grid. Build them on the simplest long-running pattern in the category.

The layout that runs longest in this category (Marée's forehead-patch static, live 323 days): the product held in a hand, one big headline, three short benefits, an offer badge and a bottom bar. Our version: "THE DAILY GLOW CO." · headline "Smoother-looking skin by morning" · benefits "Works while you sleep" / "Forehead, eyes & smile lines" / "Reusable, no needles" · badge "2 Face Sets $60 · Save $30" · bar "30-day money-back guarantee • Free shipping". The image shows only a hand holding the real sheet against a bright window.

Other static concepts with proof in the market:

- **Guarantee static:** "Try it for 30 days. Smoother-looking mornings, or your money back." Competitors run 30-night guarantees inside the ad; ours is 30 days from delivery, so word it that way.
- **Objection flip:** "Finally, a wrinkle patch that actually works." (the owner's favourite headline).
- **Sleep-crease:** "Some of the lines you wake up with come from your pillow, not your age." One angle, not the default.

Rules learned:

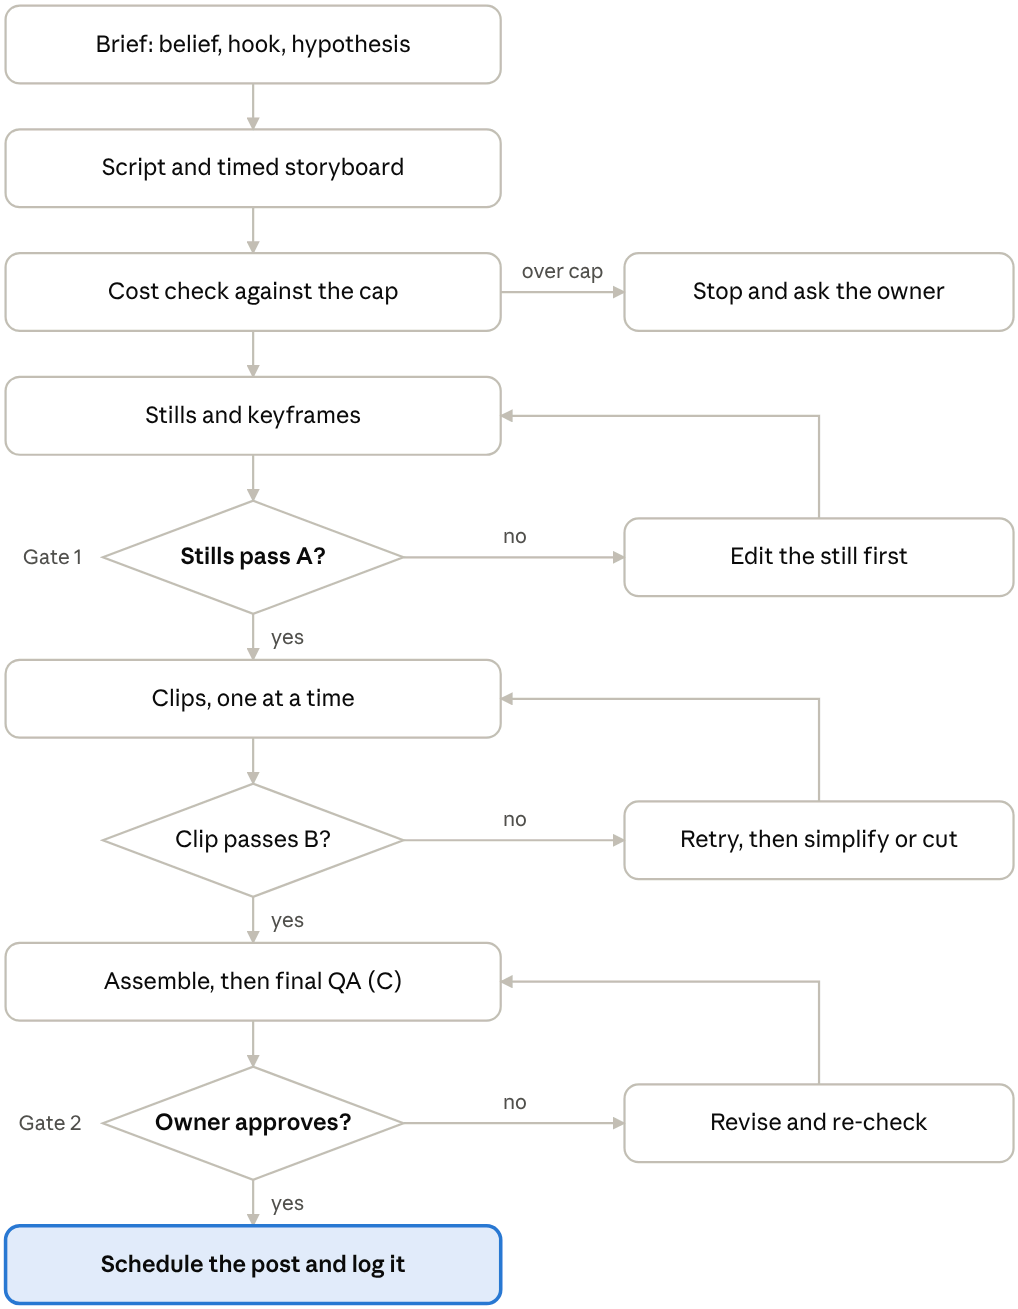

1. Default feed size 4:5, 1080 × 1350. For a 9:16 version, use the full 1080 × 1920 canvas but keep everything important inside a centered 1080 × 1080 box (roughly y 320–1400); the top and bottom bands are background only, so the same file survives Reels, Stories and square crops.
2. The proof image takes about 65% of the frame. Cut text before you shrink the proof; on a phone a small image shows nothing.
3. One idea per static: one tension, one promise, one offer.
4. Headline readable in under a second: about 9 words or fewer, large, high contrast.
5. Build in HTML/CSS with Poppins, render with Playwright at 2× and downscale. Text comes out exact, and it costs nothing.

Instagram grid launch (worked): draft the 3-tile layout in HTML first (free), get approval, generate one 21:9 4K image in Higgsfield with Elements, then cut it at the gutters into three 1080 × 1440 tiles and post right, middle, left.

Production pipeline and QA

Every creative runs through the same pipeline with two hard gates: no video credits are spent until the stills pass the checklist, and nothing goes live until the owner approves it. Most wasted credits came from skipping the first gate.

Two gates: stills before any video spend, the owner before anything goes live

production pipeline · 2 gates, 3 repair loops

A failed still is edited, never animated; a clip gets at most two repair attempts before you simplify or cut around it; only the owner approves a post.

Pipeline, in order:

1. **Brief:** concept, the one belief and objection, the hook, a written hypothesis and the metric that will judge it. Pull today's price and offer from the live store.
2. **Script and storyboard:** timed beats; clip lengths set from the voice-over word count.
3. **Cost check:** credits and dollars for every generation, against the run's budget cap. Stop and ask if it's over.
4. **Stills:** base portrait → product-on-face edit → keyframes, each an edit of the last.
5. **Gate 1, keyframe QA** (checklist A). A failed still gets edited, never animated.
6. **Clips,** one at a time, start and end frame locked, each checked (checklist B). Two repair attempts at most, then simplify or cut around the glitch.
7. **Voice, music, overlays, captions and assembly** in code. Export a master and a short Reel cut.
8. **Final QA** (checklist C).
9. **Gate 2, owner approval.** Then schedule it on Instagram and TikTok and log the post link next to the file.
10. **Log** prompts, model, settings, credits, accepted and rejected shots, and any new lesson.

A. Still and keyframe checklist (before any video)

- [ ] Same person in every frame, matching the chosen character: face, hair, age, jewellery
- [ ] Product is clear and slightly frosted, never opaque; right shape and right count for the frame
- [ ] Forehead tab points down; forehead piece covers about two-thirds of the forehead and doesn't reach the hairline
- [ ] Under-eye pieces are slim crescents just below the lashes (Face Set) or the T-shape (Eye Patches), never circles or glasses
- [ ] Smile-line pieces leave the lips uncovered
- [ ] Lips closed with patches on; hair off the forehead; no mirror, cream or text in frame
- [ ] 9:16 and readable at phone size

B. Clip checklist (after every clip)

- [ ] Everything in checklist A still holds in every frame

- [ ] Wrinkle depth didn't change mid-clip; skin not airbrushed
- [ ] Lips never opened (unless it's a talking clip, and then the words match exactly)
- [ ] No patch slid, doubled, split, vanished or turned opaque
- [ ] Exactly two hands with five fingers; hands never pass through the face or a patch
- [ ] Starts and ends on the approved frames

C. Final checklist (before asking for approval)

- [ ] Price, offer and dates match the live store today
- [ ] Product visible in the first 2 seconds; the CTA has its own full-screen beat
- [ ] Text sits below the top 14% and above the bottom 35% of the frame
- [ ] Audio at −16 LUFS; music from TikTok's Commercial Music Library, Meta's Sound Collection or another commercial-use library (business accounts can't use most trending songs)
- [ ] Link in bio and caption links point to the product page, not the homepage
- [ ] File named with concept, hook, version and date

Testing and reading results

Judge each post on whether it holds attention and then sends visitors who buy: watch time, saves and shares on the platform, then sessions and orders in Shopify, with the owner's visits (?utm_source=owner), relatives and bots removed.

Testing: write the hypothesis before posting. Vary the concept, not the cosmetics (a new font or colour rarely answers an objection). Don't call a winner on views alone.

Diagnose by where people drop: poor hook or hold → change the opening; views but few link taps → change the reason, offer or CTA; visits but no emails or orders → expectation, trust, offer or checkout, not the creative.

Open questions

Nothing here is proven profitable yet; these are the gaps that decide what the agents make next.

- **Real footage:** the category's winning format (a real woman applying and peeling on camera) has never been filmed for us.

- **Page fixes that guarantee-led creatives depend on:** the refund policy still has "[INSERT RETURN ADDRESS]" and excludes beauty products, contradicting the 30-day guarantee; no delivery estimate is shown.
- **Untested lanes:** Spanish-language content for US Hispanic buyers, and the 11-piece set and Chest Pad as hero products.
